

WHAT IS CLAIMED IS

5

1. A rotation control method for rotating an optical recording medium at two or more kinds of rotational speeds, comprising the steps of:

(a) decreasing the rotational speed when a
10 read or write margin becomes less than or equal to a first predetermined value or, when a frequency of generation of a servo abnormality of a tracking servo and/or a focus servo is greater than or equal to a first predetermined frequency; and

15 (b) increasing the rotational speed when the read or write margin becomes greater than or equal to a second predetermined value or, when the frequency of generation of the servo abnormality of the tracking servo and/or the focus servo is less
20 than or equal to a second predetermined frequency.

25 2. The rotation control method as claimed in claim 1, wherein said steps (a) and (b) respectively control the rotational speed depending on a result of at least one of a test write process and a learning process which is carried out with
30 respect to a read or write process.

35 3. The rotation control method as claimed in claim 2, wherein:
said step (a) detects that the read or write

margin is less than or equal to the first
predetermined value when an optimum write power of a
light source with respect to the optical recording
medium obtained by the test write process exceeds a
5 reference value; and

said step (b) detects that the read or write
margin is greater than or equal to the second
predetermined value when a margin greater than or
equal to a predetermined value exists with respect
10 to the reference value.

15 4. The rotation control method as claimed
in claim 2, wherein said step (a) decreases the
rotational speed when a read error rate improves at
a write power exceeding an upper limit value of a
write power obtained by the test write process or
20 the learning process.

25 5. The rotation control method as claimed
in claim 2, wherein said step (b) increases the
rotational speed when the optimum write power
obtained by the test write process or the learning
process has a sufficient margin with respect to an
30 upper limit value of the write power.

35 6. The rotation control method as claimed
in claim 1, further comprising the step of:
(c) counting up a number of times a judgement

is made to decrease the rotational speed by said
step (a) and counting down a number of times a
judgement is made to increase the rotational speed
by said step (b), and enabling said step (a) when a
5 count reaches an upper limit value and enabling said
step (b) when a lower limit value is reached.

10

7. The rotation control method as claimed
in claim 6, wherein said step (c) counts a number of
judgements made based on a result of a test write
process with a weighting larger than a number of
15 judgements made based on a result of a learning
process which is carried out with respect to a read
or write process.

20

8. The rotation control method as claimed
in claim 2, further comprising the step of:
(c) measuring an amount of eccentricity of the
25 optical recording medium,
said step (a) detecting that the read or write
margin is less than or equal to the first
predetermined value when the measured amount of
eccentricity exceeds a reference value.

30

9. The rotation control method as claimed
35 in claim 2, further comprising the step of:
(c) measuring an amount of eccentricity of the
optical recording medium,

said step (a) switching a value of the first predetermined frequency depending on the measured amount of eccentricity.

5

10 10. A storage apparatus having a spindle motor which rotates an optical recording medium at two or more kinds of rotational speeds, comprising:
a first controller decreasing the rotational speed when a read or write margin becomes less than or equal to a first predetermined value or, when a frequency of generation of a servo abnormality of a tracking servo and/or a focus servo is greater than
15 or equal to a first predetermined frequency; and
a second controller increasing the rotational speed when the read or write margin becomes greater than or equal to a second predetermined value or,
20 when the frequency of generation of the servo abnormality of the tracking servo and/or the focus servo is less than or equal to a second predetermined frequency.

25

30 11. The storage apparatus as claimed in claim 10, wherein said first and second controllers respectively control the rotational speed depending on a result of at least one of a test write process and a learning process which is carried out with respect to a read or write process.

35

12. The storage apparatus as claimed in claim 11, wherein:

5 said first controller detects that the read or write margin is less than or equal to the first predetermined value when an optimum write power of a light source with respect to the optical recording medium obtained by the test write process exceeds a reference value; and

10 said second controller detects that the read or write margin is greater than or equal to the second predetermined value when a margin greater than or equal to a predetermined value exists with respect to the reference value.

15

13. The storage apparatus as claimed in claim 11, wherein said first controller decreases
20 the rotational speed when a read error rate improves at a write power exceeding an upper limit value of a write power obtained by the test write process or the learning process.

25

14. The storage apparatus as claimed in claim 11, wherein said second controller increases
30 the rotational speed when the optimum write power obtained by the test write process or the learning process has a sufficient margin with respect to an upper limit value of the write power.

35

15. The storage apparatus as claimed in claim 10, further comprising:

5 a counter counting up a number of times a judgement is made to decrease the rotational speed by said first controller and counting down a number of times a judgement is made to increase the rotational speed by said second controller, and enabling said first controller when a count reaches an upper limit value and enabling said second
10 controller when a lower limit value is reached.

15 16. The storage apparatus as claimed in claim 15, wherein said counter counts a number of judgements made based on a result of a test write process with a weighting larger than a number of judgements made based on a result of a learning
20 process which is carried out with respect to a read or write process.

25 17. The storage apparatus as claimed in claim 11, further comprising:

a measuring unit measuring an amount of eccentricity of the optical recording medium,
30 said first controller detecting that the read or write margin is less than or equal to the first predetermined value when the measured amount of eccentricity exceeds a reference value.

35

18. The storage apparatus as claimed in claim 11, further comprising:

a measuring unit measuring an amount of eccentricity of the optical recording medium,

5 said first controller switching a value of the first predetermined frequency depending on the measured amount of eccentricity.

10

19. A rotation control method for rotating an optical recording medium at two or more kinds of rotational speeds, comprising the steps of:

15 (a) decreasing the rotational speed when a power of a light irradiated on the optical recording medium exceeds a reference value; and

(b) increasing the rotational speed when the power of the light has a margin greater than a
20 predetermined value with respect to the reference value.

25

20. A storage apparatus having a spindle motor which rotates an optical recording medium at two or more kinds of rotational speeds, comprising:

a first controller decreasing the rotational
30 speed when a power of a light irradiated on the optical recording medium exceeds a reference value; and

a second controller increasing the rotational speed when the power of the light has a margin
35 greater than a predetermined value with respect to the reference value.
